## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,734,449 (449).

Per claims 1, 10 and 20, 449 teaches a scan line disposed over a substrate [11]; a data line disposed over a substrate [see figure 4]; an active component [50]; a plurality of capacitance electrodes [13',17']; a pixel electrode [19] disposed over the transparent capacitance electrode and connected to the active component, the pixel and capacitance electrode forming a capacitor.

Per claim 2-3, the electrode 13' is connected via 20.

Per claim 4, the TFT is formed of amorphous or poly silicon [see column 3, lines 34-45]. 818 lacks the use of low temp poly silicon. However, it was well known to form TFTs from low temp poly silicon as the process requires less heat. Accordingly, it would have been obvious to one of ordinary skill at the time of invention to form the TFT of 818 using a low temp poly silicon process.

Per claim 8, 449 lacks the gate on bottom type TFT. However, it was well known to combine gate on bottom or substitute gate on bottom gate on top to improve the gate insulating layer and decrease pinhole in the insulating layer. Accordingly, it would have been obvious to one of ordinary skill in the art at the time of invention.

Per claim 9, 449 lacks an explicit teaching that the capacitance electrode is ITO or IZO. However, it was well known to form capacitance electrode from ITO or IZO in order to increase the aperture ratio of the cell. Accordingly, it would have been obvious to one of ordinary skill at the time of invention to form the capacitance electrode of 449 with the well known ITO.

***Conclusion***

This is a RCE of applicant's earlier application. All claims are drawn to the same invention claimed in the earlier application and could have been finally rejected on the grounds and art of record in the next Office action if they had been entered in the earlier application. Accordingly, **THIS ACTION IS MADE FINAL** even though it is a first action in this case. See MPEP § 706.07(b). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no, however, event will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

***Response to Arguments***

Applicant's arguments have been addressed in the advisory action.
